

## Hydrocarbon Detection Strips for oil testing & detection can quickly and accurately determine the presence of hydrocarbons in water

**PRODUCT DESCRIPTION:** The Hydrocarbon Detection Strips can quickly and accurately determine the presence of hydrocarbons in water. When the Hydrocarbon Detection Strip is introduced into a potential hydrocarbon situation, the light blue strip will turn a darker blue if hydrocarbons are present. The colour intensity and size of the darker blue areas are indicators of the quantity of hydrocarbons contained in the sample. If the sample contains no hydrocarbons, the strip will not moisten or discolour.

**PRODUCT APPLICATIONS:** Hydrocarbon Detection Strips can be used to detect hydrocarbon contaminated water in elevator shafts, underground utility vaults and manholes, retention and secondary containment vessels, and out-fall on oil water separators prior to pumping out the water.

Example of Hydrocarbons	Lower Limit PPM of Water	Clearly Detectable PPM of Water
Petroleum Ether (B.P. 40-80C)	250 PPM	400 PPM
Gasoline (High Octane)	10 PPM	25 PPM
Heating Oil	5 PPM	10 PPM
Lubricating Oil	1 PPM	5 PPM

When testing volatile substances, the colour reaction must be evaluated immediately due to rapid fading.

**BENEFITS:** • The Hydrocarbon Detection Strip measures 2.75" x .75" and comes 100 in a hard plastic container. • The Hydrocarbon Detection Strips can detect the presence of hydrocarbons in water prior to pumping thus eliminating potential fines.

Part # PHOS-PREP® PP HDS - 001
